Sequence 287, Application PC/TUS0304088

GENERAL INFORMATION:
APPLICANT: Bloozwne Pharmaceuticals, Inc.
APPLICANT: Beigelman, Leonid
TITLE OF INVENTION: RAM Interference Mediated Inhibition of Telomerase Gene
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

SERBEAL INPORMATION:

APPLICANT: Maren T. Scheuner (Inventor)

APPLICANT: Maren T. Scheuner (Inventor)

APPLICANT: Hujving Yang (Inventor)

TITLE OF INVENTION: Genetic Test to Determine

TITLE OF INVENTION: No. US20020106657A1-responsiveness to Statin Drug Treatment

FILE REFERENCE: 18810-82302

CURRENT APPLICATION NUMBER: US/09/898,779

CURRENT FILING DATE: 2001-07-03

PRIOR FILING DATE: 1999-07-02

NUMBER OF SEQ ID NOS: 110

SEQ ID NO 110

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

GENERAL INFORMATION:
APPLICANT: Cros, Phillippe
APPLICANT: Allibert, Patrice Andre
APPLICANT: Allibert, Patrice Andre
APPLICANT: Dalbon, Pascal Thierery
APPLICANT: Dalbon, Percess for Immobilizing a Nucleic Acid
TITLE OF INVENTION: Fragment by Passive Attachement to a Solid Substrate, the
TITLE OF INVENTION: Solid Substrate thus Obtained and Its Use.
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: Oliff and Berridge
STREET: 700 S. Washington St.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

GENERAL INFORMATION:

APPLICANT: Akio YAMANE

TITLE OF INENTION: Microtiter Well For Detecting

CORRESPONDENCE ADDRESS:

STREET: 805 Fifteenth Street, N.W., #700

CITY: Meshington

CITY: Weshington

CONFUTER: READABLE FORM:

MORIUM TYPE: Diskette, 5.25 inch, 500 KD

COMPUTER: READABLE FORM:

MORIUM TYPE: DISKETTE, STREET, MA-DOS

SOFTWARE: US. OS SOFTWARE:

COMPUTER: THE COMPUTER: US. OS SOFTWARE:

CLASSIFICATION NUMBER: 08-004,572

RELIEF AND APPLICATION NUMBER: 08-004,572

FILING DATE: James 28, 1931

APPLICATION NUMBER: 08-1931

APPLICATION NUMBER: 08-1931

APPLICATION NUMBER: 08-1931

APPLICATION NUMBER: 08-1931

Application US/08913547A

Patent No. 6027891

GENERAL INFORMATION:

APPLICANT: WORNER, Stefano

APPLICANT: WORNER, Stefano

APPLICANT: WORNER, Stefano

TITLE OF INVENTION: A PATHOD OF EALLY DETECTION OF

TITLE OF INVENTION: APV-ASSCIATED CARCINOMAS AND EXTREME DYSPLASIAS

TITLE OF INVENTION: CAUSED BY HPV

TITLE OF INVENTION: CAUSED BY HPV

TITLE OF INVENTION: US/08/913,547A

CURRENT APPLICATION NUMBER: US/08/913,547A

CURRENT FILING DATE: 1998-01-28

NUMBER OF SEQ ID NOS: 24

SOFTWARE: FaetSEQ for Windows Version 3.0

SEQ ID NO 3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 25, Application US/08944368A
Patent No. 6228368
GENERAL INFORMATION:
APPLICANT: GISSMan, et al.
TITLE OF INVENTION: Papilloma Virus Capsomere Vaccir
TITLE OF INVENTION: Pomulations and Methods of Use
                                                                                                                                                                                              ATTORNEY/AGENT INFORMATION:

NAME: SANGERCOCK, COLIN G.

REGISTRATION UNMBER: 37.067/102

REFERENCE/DOCKET NUMBER: 37067/102

TELECOMMUNICATION INFORMATION:

TELEFAX: (202) 672-5399

INFORMATION FOR SEQ ID NO: 24:

SEQUENCE CHARACTERISTICS:

LENGTH: 36 base pairs

TYPE: NUCLSIC acid

STRANDEDNESS: single
APPLICATION NUMBER: US/09/820,764
FILING DATE: 30-Mar-2001
CLASSIFICATION: <Unknown>
                                                                                                                                              APPLICATION NUMBER: US 09/026,896
FILING DATE: 20-FEB-1998

Sequences shown in AAV41169 to AAV41181 represent antisense
oligonuclectides to the RNA component of human telomerase (HTR). These
antisense oligonuclectides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
hybridise to a sequence within the template region of HTR. These
cligonuclectides may specifically be used for detection of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitor,
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
oligonuclectides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
half-life of the telomerase RNA component transcript, inhibiting the
colon than the telomerase holoenzyme, or inhibiting the
polymerase activity of telomerase. These antisense oligonucleotides can
be used for inhibiting telomerase activity; in both outlured cells and in
cells in vivo. They can be used in therapeutics for treating or
immunosuppression, and for selectively down-requilating specific branches
of the immune system, e.g. a specific subset of T-cells, in
anti-inflammatory therapies or for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          component; human telomerase; antisense oligonucleotide; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neuroblastoma; bladder cancer; colon cancer; prostate cancer; cancer; contraception; sterilisation; immunosuppression; therapeutic; hTR; immune system down-regulation; anti-inflammatory therapy; ss.
              New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 20; DB 19; Length 20; 100.0%; Pred. ```
Sequences shown in AAV41169 to AAV41181 represent antisense

cligonucleotides to the RNA component of human telomerase (hTR). These
antisense coligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
compound the sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
connec (especially neuroblastoma, bladder, colon and prostate cancer),
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
cligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
conformation of the telomerase RNA component transcript, inhibiting the
collectivity of telomerase rhese antisense oligonucleotides can
be used for inhibiting telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in wine system, e.g. a specific subset of T-cells, in
cant-inflammatory therapies or for treating infections by, e.g. yeast,
confunction or for for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modulator; GC6 gene; senescent gene expression;
                               detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection

senescence. Recombinant expression vectors comprising a recombinant polymucleotide corresponding to a polymucleotide in a human GGG gene, are useful for altering senescent gene expression. The vectors and host cells comprising the protein gene expression. The polymucleotides are useful for modulate senescent gene expression. The polymucleotides are useful for producing the protein, gGGG and mucleic caid derivatives. The proteins encoded are useful for raising antibodies specific for pGGG, which are useful for isolating pGGG, and for detecting cells comprising pGCG, which are complex cell mixtures. The characterization of the polymucleotides enable the identification of therapeutic agents that identify and distinguish between young and senescent cells. This enables treatment of aging diseases induced or exacerbated by cellular senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to three polymorphic variants of a rat transcriptional regulatory factor Elf-1 (AAB03199-B03192) and nucleic acids encoding them (AAAA61645-A61647). The invention also encompasses the use of Elf-1 for regulating the transcription of a gene in an expression vector. The CDNA encoding rat Elf-1 variant #1 (AAA61645) was isolated using PCR primers (AAA61648-A61649) based on mouse Elf-1 CDNA, and the rat Elf-1 variant #2 and 3# CDNAs (AAA61646-A61647) were subsequently isolated. The Elf-1 CDNA and protein sequences are potentially useful for the prevention and treatment of immunological and allergic diseases mediated by Elf-1. Sequences AAA61648-A61649 represent mouse Elf-1 variant #1 cDNA.

The present invention describes a method of arraying genome clones. The method comparises: a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. of the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. corrected to the arraindination Nos. are mixed respectively in each wells of longitudinal cand lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed for microarray is useful for gene analysis. ABM45357 to ABM45322 represent

This invention describes Secale cereale microsatellite markers based on hypervariable genomic segments of Secale cereale and plants of the tribes Triticeae and Poeae. The Microsatellite markers comprise a simple sequence repeat (SSR) marker as sequence tag site (STS), defined by two specific S. cereale defined primers, of mean length 18-26 bases and flanking the microsatellite sequence (MSS). Such markers are useful for genetic analysis of rye, triticale and other species of the tribes Triticeae and Poeae, e.g. for DNA fingerprinting; identification of varieties; detecting self or cross fertilization; studying similarity and realatedness; characterization of cytological lines, or generally any can relatedness; characterization of cytological lines, or generally any can marking of mono- or poly-genic traits, selection and evaluation of varietal purity or checking culture stages (particularly in hybrid culture methods), purity of propagative materials, success of culture methods), purity of propagative materials, success of culture methods), purity of propagative materials, success of hybrids. AAX36902-X36965 represent. PCR primers used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Intercellular adhesion molecule 6; ICAM-6; drug screening; therapy; intercellular adhesion; inflammatory process; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Microsatellite markers derived from the genome of rye, useful for genetic mapping as markers of monogenic or polygenic traits

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel microsatellite markers (MSM), based on the hypervariable genomic regions of rye (Secale cereale) and of plants from the tribes Triliceae and Poese. MSM, which are new genetic markers for rye and closely related species, are used for genetic analysis and in breeding programs. Typical applications are in DNA fingerprinting; identification of varieties; detection of self and cross pollination, characterization of cytoplasmic lines, and genetic mapping (of mono- or poly-genic traits). MSM show a higher degree of polymorphism than known markers (both within and between different rye varieties and lines); can

                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                              The specification describes an intercellular adhesion molecule (ICAM)-6 polypeptide. The ICAM-6 polypeptides and polymucleotides can be used for drug screening and developing products for therapy involving intercellular adhesion, e.g. in inflammatory processes. The products can also be used for detection, diagnosis and the production of transgenic animals. PCR primers AAX36170-73 were used

polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (1) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (1) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (1) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be used as antigens in the therapy. The polypeptides encoded by (1) may be used as antigens in the antibodies may also be used as diagnostic polypeptides. The antibodies may also be used as diagnostic agents for detecting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences (I), which contain single nucleotide polymorphisms (SNPs).
AAM53134 to AAM53132 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polymorphides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polymeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the

New modified form of factor VIII, useful for treating hemophilia, has altered binding to low density lipoprotein-related protein, resulting in extended in vivo half-life Example XI; Page 35; 57pp; German.

This invention describes a novel factor VIII polypeptide (I) with factor VIII: a activity which has a modification in at least one of the A3, C1 and/or C2 domains of the light chain that modifies binding affinity to low density lipoprotein receptor-related protein (LRP). Independent Calaims are also included for the following: (1) DNA (II) that encodes (I); (2) an expression vector containing (II); (3) transformed cells and their descendants containing (II); (4) recombinant production of (I) by culturing cells of (c); and (5) pharmaceutical composition containing a factor VIII molecule (Ia) with factor VIII: activity plus an LRP antagonist (III). The products of the invention have antihemophilic activity. (1) has reduced affinity for LRP, a receptor involved in activity. (1) has reduced affinity for LRP, a receptor involved in antagonist of LRP, is used for treatment of coagulation disorders, specifically hemophilia A. It may also be used to treat subjects with

```
disorders of the thrombotic or fibrinolytic systems, e.g. before, during or after surgery. Nucleic acid that encodes (I) can be used similarly in gene therapy. The light chain modifications reduce clearance of factor VIII protein from the blood, resulting in longer in vivo half-life (particularly at least 90% greater than wild type) and increased stability, in vivo or in vitro. The modifications do not adversely affect procoagulant activity. The modifications do not used in the construction of the plasmid pC2-m%#518 which contains the Pactor VIII light chain C2 region which is described in the method of the
                                                                                                                                                                                                                                                                               invention.

Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 103251; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF0010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABF0010-ABE99989 and ABI00010-ABE99989 and ABI00010-ABE9998 and ABI000010-ABE9998 and ABI000010-ABE9998 and ABI000010-ABE9998 and ABI000010-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1, SEQ ID 233118; 29pp + Sequence Listing, German.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwd2 (gil 4732114 [gb] AR129072.1); a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AZ393281

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pMQ2 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LOCUS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess: The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwh912 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

//note="Netcot: PMAZIV; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarces gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the innest adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-complement E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

/lab host="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel

Vecfor DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored to chemically-competent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 100,

Sequence 135, Application US/09166186A
Patent No. 6080580
GENERAL INFORMATION:
APPLICANT: Baker, Brenda
APPLICANT: Bahnett, C. Frank
APPLICANT: Bahnett, C. Frank
APPLICANT: Shanahan, William R.
TITLE OF INVENTION: ANTIENSE OLIGONUCLEOTIDE MODULATION OF TNF-a EXPRESSION
FILE REPERBNOE: 15PH-0322
CURRENT APPLICATION NUMBER: US/09/166,186A
CURRENT FILING DATE: 1998-10-05
NUMBER OF SEQ ID NOS: 250
SEQ ID NO 135
LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 115, Application US/09313932A

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
